2 new releases of PHP (PHP Hypertext Processor) were just announced - 5.2.14 and 5.3.3. Both releases focus on stability and security, addressing several different issues. The 5.2.14 release marks the end of the support of the 5.2 series of PHP. No further bug fixes will be released for this version and security fixes will be addressed individually. The 5.3.3 release moves it further ahead in support of namespaces and does introduce a break in compatibility for class constructors. The change only affects previous versions of PHP5.3, since namespaces were introduced in the 5.3 series.

For full details about the changes in these releases, you can view the [changelog for 5.2.14](#) and the [changelog 5.3.3](#). PHP has also provided a [migration guide](#) to assist with the changes between 5.2 and 5.3.
