It appears the PHPÂ development team has not quite put the 5.2 series to bed and have <u>released</u> <u>another update</u> for it. PHPÂ 5.2.16 addresses a regression error introduced in 5.2.15 for open_basedir implementations. If you use open_basedir in your application and are using PHPÂ 5.2.15, you should update your PHPÂ installation to 5.2.16 or 5.3.4. PHPÂ 5.2.16 also fixes a crash in the PDO::pgsql driver when attempting to retrieve data when the server is unavailable.

For a full list of changes in PHP 5.2.16, you can <u>view the change log</u>. And for information about migrating from 5.2 to 5.3, you can go through their <u>migration guide</u>.
