The PHPÂ developers have [released another update for both the 5.2 series and the 5.3 series](#). There is a critical issue that can cause PHPÂ to hang and crash, causing your application to stall. They have provided a simple script you can run on your server (only from the command line, so this isn't for most people to test) to test for the vulnerability. IÂ ran it in my local test environment and found it failed the test. If your server is affected, you are strongly urged to upgrade to PHPÂ 5.2.17 or 5.3.5.
