As you can see below, this has been a busy summer for the PHP development team - releasing new versions every month, with each version addressing more than 20 issues. Some vulnerabilities and security issues were also fixed in various releases.

08-May-2012 The PHP development team announces PHP 5.4.3 and PHP 5.3.13. 14-Jun-2012 The PHP development team announces PHP 5.4.4 and PHP 5.3.14. 19-Jul-2012 The PHP development team announces PHP 5.4.5 and PHP 5.3.15. 16-Aug-2012 The PHP development team announces PHP 5.4.6 and PHP 5.3.16. 13-Sep-2012 The PHP development team announces PHP 5.4.7 and PHP 5.3.17. The full list of changes to PHP 5 are recorded in the [ChangeLog](#). Here are the tips for migrating your PHP applications to [PHP 5.3](#) and [PHP 5.4](#). If you are a site administrator or you are in the market for a web host, be sure your hosting provider has made the proper steps for upgrading your services to the latest version of PHP, as well as MySQL and Apache (or IIS, if you are on a Windows server). Also, check your web application platform (usually a content management system) for their readiness to support these versions of PHP. [ImpressCMS](#) supports PHP 5.3 in version 1.2.3 and higher (latest is 1.3.2.1). The latest [XOOPS](#) functions in PHP 5.3, and their release notes for versions 2.5.0 state it will run on 5.2 and higher. [Drupal](#) supports 5.3 in versions 6.14 and higher and in version 7. [Joomla!](#) versions 1.5.15 and higher are compatible with PHP 5.3. [WordPress 3.2](#) is compatible on PHP 5.3.
